

Basics of SQL in 08/07/2026 session.

Database → storage of data

↓
server (connect data)

Schema → is creation of tables

Workbench → connection of tables to MySQL servers.

DDL commands → create table, define the data.
↳ insert values
↳ update and delete data

Truncate, delete and ~~delete~~ drop

↓
Delete the entire data. all rows.

↓
delete particular rows in data

↓
delete entire table, entire DB.

→ important to give where conditions.

→ truncate is not suggested use in production.

→ DROP whole table.

→ Primary Key and Foreign Key

↓
unique ID
for 1 table
to relate
data

↓
used in table joins

→ only '1' primary key, always have
whole table as primary key ??

→ Can have multiple unique IDs.

→ Joins should be based on Unique Identifier
→ merging of multiple columns to define
the primary key

→ multiple foreign keys.

• 09/07/2026 - start

→ DAL → data query language.

"Select" → querying the data/retrieve.

↓
retrieval latency / computation. (out of memory??
API call to
MySQL server)

→ "DISTINCT" for common entities)

"is null" → filter.

"where" → common filter

→ reducing the computation.

→ count → to check the number of rows

count (*)

count (distinct (title))

↳ give count of distinct titles.

↳ checking for duplicates in production.
↓
duplication issues.

"group by"

→ reduce the columns by asking specifics

→ limits → number of records.

↓
no unique records.

→ "and" → checks for multiple conditions

→ "or" → either one of checks.

Sorting :-

ASC (or) desc order.

↓
retrieved data in specific order.

"ORDER BY" → keyword for sorting.

↓
defaults "ASC"

first name → alphabetically.
float → value based

#NOT / Not in

select * from x where duration not in (set)

"! =" → not

this is correct.

Rating = 'PG' (or) Rating = 'G'

Rating = 'PG' (or) 'G' ↓ can use

where rating in ('PG', 'G')

wild card filtering. (used for partial knowledge of column used for filtering)

→ select city from sakila where city like
starts with 'A' and ← "A%S"
ends with S

→ like clause

% → any number of characters.

' - ' → used to represent a single character.

% PG %

↳ contains "PG".

% Super %

} → most important filtering.

~~Q. 2~~

" - - S - S - S " → ^{we} ~~we~~ should percentile.

→ Null values (Data cleaning. handling data for training).

↓

there are some importance of "Null"

↓
can't remove all nulls.

→ between operator:-

for comparing between the upper limit and lower limit

→ group by and having

group by ??

↓

give the entry you want to shuffle by

select * from rental where customer_id = 168;

can we use where instead of where

where is used for individual rows.

↓
having is used for aggregated data.
using group by.

order of consideration matters during aliasing and filtering.

Use all the columns in select for same in

group By

as is used aliasing.
