

→ extension to python. important class

file operations
connection to DB

→ CSV files, txt files, pdf files, .png, mp3
any type of data.

• txt files

→ with open ("location", "w") as f: ↗ write mode.

f.write ("u %s \n")

↓
writing something to text file.

→ reading text file.

with open ("location", "r") as f

(content = f.read())
print (content) → read the content.

for line in f

print ("line:" line.strip())

↗ how does this
strip work

↓
cleans extra
spaces.

→ write mode

↓
erases the previous content.
overwrites previous content.

→ that's why append mode.

"a"

→ file.read(10)

↓
gives first 10 characters.

→ file.readline().strip()

→ removes white spaces.

↓
reads line by line.

→ file.readlines()

↳ all lines in a list format.

→ # copy file

from src to dest.

→ in write mode it will create the file for you if it doesn't exist

→ .csv, .xlsx

→ pandas as pd (important for structured data)

data frame → 2 dimensional data store

data = $\{K_1 : v_1, K_2 : v_2\}$

K_1	K_2
v_1	v_2

 → df.

df = pd. [↑]DataFrame (df)

read read-excel	to-excel
read-csv	to-csv
read read-json	to-json

Module, libraries and packages.

not single python file which has inbuilt functions

`import os`, `import datetime`

`import sys`

`help (math.floor)`

↓
gives us the info.

Exception handling:-

try :

except :

else :

finally :

write in try ~~then~~

if not

except :

if yes

else

finally :

after checking try then

we execute the final in any case.

→ Database connection.

```
db = sqlite3.connect("db name")
```

```
db.execute("drop table")
```

we can also connect mysql DB
